**MVBx**
Expansion units for connection to the most common industrial Fieldbus systems for diagnostics and data communication.

**MAx**
Analog input expansion unit.

**MVx**
Expansion units for safety speed monitoring.

**MOR4, MOR4S8**
Safety relay units with configurable outputs.

**M1 (Standard) or M1S (Enhanced)**
Master Unit
The Master Unit can be used as a stand-alone device or to control other expansion units.

**MBx**
Expansion units for connection to the most common industrial Fieldbus systems for diagnostics and data communication.

**M1 (Standard) or M1S (Enhanced)**
Master Unit
The Master Unit can be used as a stand-alone device or to control other expansion units.

**M1x, M0x**
Additional Input/Output units.

**Mosaic Safety Communication (MSC)**
Allows communication between the various units through a proprietary high-speed safety bus.

**Removable terminals**
Two versions available - with clamp contacts - with screw contacts.

**USB Connection**
USB 2.0 serial bus for the connection to Mosaic Safety Designer (MSD) software.

**Mosaic Configuration Memory (MCM)**
Removable memory card for saving Mosaic configuration data for subsequent transfers to a new device (without using a PC) or for backup.
KEY FEATURES

- Mosaic is a safety hub able to manage all safety functions of a machinery. Configurable and scalable, allows cost reductions and minimal wiring.

- **Mosaic can manage safety sensors** and signals such as:
  - Light curtains
  - Photocells
  - Laser scanners
  - Emergency stops
  - Electromechanical switches
  - Guard-lock safety door switches
  - Magnetic switches
  - RFID switches
  - Inductive sensors
  - Safety mats and edges
  - Two-hands controls
  - Hand grip switches
  - Safety switch with guard locking
  - Encoders and proximities for safety speed control
  - Loading cells, pressure switches, temperature measurements, flow and level measurements

ADVANTAGES

Compared to “traditional” electromechanical safety-relays-based safety circuitries, Mosaic has the following advantages:

- Reducing the number of devices and wiring used and, therefore, the overall size of the project
- Speeding-up control panel construction
- Providing logic configuration via a quick and easy-to-use software. Machine designers are always able to change configuration logic
- Master units M1 and M1S configurable via the MSD (Mosaic Safety Designer) graphic interface (provided with each Master units at no extra cost)
- Simply adding or removing safety function blocks at any stage of machine design
- Is able to check the logic configuration of the application during the designing phase through the validation function and Simulation as well as to test it during the installation through the monitor function
- Allows tamper-proof system configurations as:
  - detection of tempering attempts through specific tests (i.e. mandatory test of the safety device at machine start-up)
  - protection against unauthorized changes to the project through a 2-level password
- All logic is configured through a graphic interface. No more laborious wiring is needed as with traditional solutions
- A lower number of electromechanical components also means a better Performance Level and, therefore, a higher Safety Level
- The project report provides the actual values of PFH\(_{d}\), DC\(_{avg}\), and MTTF\(_{d}\) according to EN 13849-1 and EN 62061
**Master Unit M1**

*Standard Master Unit*
- 8 digital inputs
- 2 inputs for Start/Restart interlock and EDM
- 2 pairs OSSD safety outputs (PNP 400 mA)
- 2 status outputs (PNP 100 mA). See note 2
- 4 test outputs (for short-circuits monitoring)

*Not compatible with the following expansion units: MA2, MA4, MI8O4, MO4L*

---

**MVx**

*Speed monitoring expansion units*
- Safety speed monitoring (up to PL e)
- For: zero speed control, maximum speed control, speed range control, direction control

---

**Additional inputs**

*MIx / MI12T8 / MAx*

*Input expansion units*
- **MI8**
  - 8 digital inputs
  - 4 test outputs (for short-circuits monitoring)
- **MI16**
  - 16 digital inputs
  - 4 test outputs (for short-circuits monitoring)
- **MI12T8**
  - 12 digital inputs
  - 8 test outputs (for short-circuits monitoring)

*Can manage up to 4 independent safety mats/edges*

---

**MV0**

*Inputs for 2 proximity switches*

---

**MOx / MO4L HC S8 / MO4L**

*Output expansion units*
- **MO2**
  - 2 pairs OSSD safety outputs (PNP 400 mA)
  - 2 inputs for Start/Restart interlock and EDM
  - 2 status outputs (PNP 100 mA). See note 2
- **MO4**
  - 4 pairs OSSD safety outputs (PNP 400 mA)
  - 4 inputs for Start/Restart interlock and EDM
  - 4 status outputs (PNP 100 mA). See note 2
- **MO4L HC S8 POWER**
  - 4 single OSSD safety outputs or 2 pairs (PNP 2,0 A for each channel, total current 8 A)
  - 4 inputs for Start/Restart interlock and EDM
  - 8 status outputs (PNP 100 mA). See note 2
- **MO4L**
  - 4 single OSSD safety outputs or 2 pairs (PNP 400 mA)
  - Up to 4 inputs for Start/Restart interlock and EDM. See note 1
  - Up to 4 status outputs (PNP 100 mA). See note 1 and 2
Master Unit M1S
Enhanced Master Unit
8 digital inputs
4 inputs for Start/Restart interlock and EDM. See note 1
4 single OSSD safety outputs, or 2 pairs (PNP 400 mA)
4 status outputs (PNP 100 mA). See note 1 and 2
4 test outputs (for short-circuits monitoring)
Compatible with all expansion units

...to the Master Units

Safety relays

MOR4 / MOR4 S8 / MRx
Safety relay output expansion units
MR2
2 safety relays with guided contacts
2 NO + 1 NC contacts (250 VAC 6 A)
1 NC contacts for EDM feedback

MR4
4 safety relays with guided contacts
4 NO + 2 NC contacts (240 VAC 6 A)
2 NC contacts for EDM feedback

MR8
8 safety relays with guided contacts
8 NO + 4 NC contacts (240 VAC 6 A)
4 NC contacts for EDM feedback

MOR4
4 safety relays with guided contacts
4 NO contacts (250 VAC 6 A)
It is possible to select two different configurations via MSD:
- 4 independent single channel outputs
- 2 dual channel outputs
4 inputs for Start/Restart interlock and EDM

MOR4S8
As MOR4, with 8 status outputs (PNP 100 mA)

Communication

MBx
Field-bus interface units
Profibus DP
DeviceNET
CANopen
EthernetIP
EtherCAT
Profinet
Modbus RTU
Modbus TCP
CC-Link
USB

MCT
Mosaic bus transfer
Interface unit allowing the connection of remote expansions via proprietary MSC bus

MCT1
1 connection interface (1 I/O)

MCT2
2 connections interface (2 I/O)

MI8Ox
Input/Output expansion units
MI8O2
8 digital inputs
2 inputs for Start/Restart interlock and EDM
2 pairs OSSD safety outputs (PNP 400 mA)
2 status outputs (PNP 100 mA). See note 2
4 test outputs (for short-circuits monitoring)

MI8O4
8 digital inputs
up to 4 inputs for Start/Restart interlock and EDM. See note 1
4 single OSSD safety outputs or 2 pairs (PNP 400 mA)
4 status outputs (PNP 100 mA). See note 1 and 2
4 test outputs (for short-circuits monitoring)

Additional inputs/outputs

MOSx
Status output expansion units
MOS 8
8 status outputs (PNP 100 mA)
See note 2

MOS16
16 status outputs (PNP 100 mA).
See note 2

Note 1:
The total number of feedback inputs + status outputs must be not greater than 4. Example: if 3 feedback inputs are used, only one status output can be used

Note 2:
Safety Level of status outputs:
SIL 1 - SILCL1 - PLC c

Additional status outputs
M1

STANDARD MASTER UNIT

Master unit, also usable as a stand-alone device, able to control any other expansion unit (not compatible with: MI8O4, MO4L and MA4). With 8 digital inputs and 2 pairs OSSD safety outputs.

APPLICATION EXAMPLE

Stand-alone: To provide protection for a smaller machinery connecting for example 1 safety light curtain, 1 e-stop, 1 magnetic sensor and 1 two-hand switch.

As Master unit: To control a more complex system providing protection for bigger machineries.

ENHANCED MASTER UNIT

Master unit, also usable as a stand-alone device, able to control any other expansion unit. With 8 digital inputs, 4 single or 2 pairs OSSD safety outputs.

APPLICATION EXAMPLE

The enhanced version of the master unit allows to control complex system and machinery that require a greater number of safety outputs, status outputs and logical operators.

**MI8O2 - MI8O4**

**INPUT/OUTPUT EXPANSION UNITS**

Input/output expansion unit. With 8 digital inputs and 2 (MI8O2) or 4 (MI8O4) OSSD safety outputs. MI8O4 allows to configure the safety output as single channel.

### Application Example

To provide more inputs and outputs for a smaller machinery connecting for example extra safety sensors and/or e-stops buttons and to control 2 extra actuators.

### Technical Features

- **Digital inputs**: 8 digital inputs
- **Safety outputs**: 2 pairs OSSD (MI8O2) 4 single OSSD or 2 pairs OSSD (MI8O4)
- **EDM/RESTART**: 2 (MI8O2), 4 (MI8O4)
- **Test outputs**: 4
- **Status outputs**: 2 (MI8O2), 4 (MI8O4)

MI12T8
INPUT EXPANSION UNIT

Input expansion unit for safety mats and edges. With 12 digital inputs and 8 test outputs for sensor monitoring.

APPLICATION EXAMPLE

With 8 test outputs can manage up to 4 independent safety mats or edges. Test output signals are used to monitor overloads and short circuits on input lines.

TECHNICAL FEATURES

- Digital inputs: 12 digital inputs
- Test outputs: 8 test outputs for sensor monitoring
- LED signalling: Input/output status and fault diagnostics
- Connection to Master Unit: Via MSC connector (included)

MA2 - MA4
ANALOGUE INPUTS EXPANSION UNIT

With 2 (MA2) or 4 (MA4) independent isolated analogue channels (500 V). Individual channels can be paired-up to allow sensor reading redundancy.

APPLICATION EXAMPLE

Any application requiring analogic sensors connection as loading cells, pressure switches, temperature measurements, flow and level measurements, etc.

TECHNICAL FEATURES

- Analogue inputs detection: Each channel can detect a 4-20 mA current or a 0-10 V voltage (selectable via software)
- Analogue inputs power supply: Each channel can supply 24V DC up to 30 mA
- LED signalling: Input status and fault diagnostics
- Connection to Master Unit: Via MSC connector (included)
- Resolution: 16 bit
- Sampling per second: 2,5 SPS ... 4000 SPS selectable
- Comparators: Simple with 1 or 2 thresholds

**MO2 - MO4**

**OUTPUT EXPANSION UNITS**

Output expansion units with 2 (MO2) or 4 (MO4) safety outputs pairs increase the number of safety outputs of a Master unit.

**APPLICATION EXAMPLE**

To provide more safety outputs in a machine where different actuators need to be controlled. For example, automatic packaging machines, etc.

**SAFETY OUTPUTS**

- MO2: 2 OSSD pairs (PNP 400 mA output current)
- MO4: 4 OSSD pairs (PNP 400 mA output current)

**EDM/RESTART**

- MO2: 2 inputs for Start/Restart interlock and external device monitoring (EDM)
- MO4: 4 inputs for Start/Restart interlock and external device monitoring (EDM)

**STATUS OUTPUTS**

- MO2: 2 programmable digital signal outputs - (PNP 100 mA output current)
- MO4: 4 programmable digital signal outputs - (PNP 100 mA output current)

**LED signalling**

Input/output status and fault diagnostics

**Connection to Master Unit**

Via MSC connector (included)

**TECHNICAL FEATURES**

**MO4L**

**OUTPUT EXPANSION UNIT**

Output expansion unit with 2 pairs OSSD or 4 single OSSD safety outputs (PNP 400 mA), 4 relative inputs for external feedback contacts (EDM) and 4 status output.

**APPLICATION EXAMPLE**

To provide 2 different output configurations (configurable with MSD configuration software)

- 4 single OSSD (1 safety output per channel with 4 feedback inputs)
- 2 pairs OSSD (2 safety output per channel with 2 feedback inputs)

**SAFETY OUTPUTS**

- 4 single OSSD (or 2 pairs)

**EDM/RESTART**

- 4

**STATUS OUTPUTS**

- 4

**COMPATIBILITY**

MO4L HC S8 POWER
HIGH CURRENT OUTPUT EXPANSION UNIT
Output expansion unit with 2 pairs OSSD or 4 single OSSD high current safety outputs (PNP 2.0 A per channel, 8 A in total), 4 relative inputs for external feedback contacts (EDM) and 8 status output.

APPLICATION EXAMPLE
To provide 2 different high current output configurations (configurable with MSD configuration software)

- 4 single OSSD (1 safety output per channel with 4 feedback inputs)
- 2 pairs OSSD (2 safety output per channel with 2 feedback inputs)

Code Description
1100032 MO4LHC58 Expansion unit - Screw terminal blocks
1100132 MO4LHC58C Expansion unit - Clamp terminal blocks
1100079 CPM - Polarizing keys for Mosaic connectors

MO4
SAFETY RELAY UNIT WITH CONFIGURABLE OUTPUTS
Output expansion unit with 4 configurable safety relays with guided contacts.

APPLICATION EXAMPLE
To provide 4 configurable guided contact safety relays. It allows to select the safety category via MSD:

- Safety Cat. 1: 4 independent single channel outputs
- Safety Cat. 2: 4 independent single channel outputs with OTE (Output Test Equipment)
- Safety Cat. 4: 2 independent double channels outputs

SAFETY RELAY 4
EDM/RESTART 4

MR2 - MR4 - MR8
SAFETY RELAY UNITS

Output expansion units provide 2 (MR2), 4 (MR4) or 8 (MR8) safety relays outputs with guided contacts connectable to OSSD safety outputs. These units can also be used separately from the Mosaic system.

APPLICATION EXAMPLE

To provide 2, 4 or 8 guided contact safety relay in applications where there is the need to cut the actuators power supply. Each NO contact is interrupted twice by the safety relays.

SAFETY RELAY
2 (MR2); 4 (MR4); 8 (MR8)
COMPATIBILITY
M1 and M1S
MR8 allows series connection of many contacts for EDM feedback (up to 13)

TECHNICAL FEATURES

MR2 - 2 safety relays with guided contacts:
2 NO + 1NC (250 VAC 6 A)
1 NC for EDM feedback (24 VDC)

MR4 - 4 safety relays with guided contacts
4 NO + 2 NC (250 VAC 6 A)
2 NC for EDM feedback (24 VDC)

MR8 - 8 safety relays with guided contacts
8 NO + 4 NC (250 VAC 6 A)
4 NC for EDM feedback (24 VDC)

LED signalling OSSD output status (input in MRx)
Connection to Master Unit The MR2, MR4 and MR8 expansion units do not require MSC as they are wired directly to the selected OSSD

  - 1 Encoder
  - 1 or 2 Proximities

- **INPUT MV2**
  - 1 or 2 Encoders
  - 1 or 2 Proximities

- **AXIS MV0**
  - 2

- **AXIS MV1**
  - 2

- **AXIS MV2**
  - 2

**COMPATIBILITY**
- M1 and M15
- M1 and M15
- M1 and M15

**APPLICATION EXAMPLE**

Any application requiring speed monitoring for a hazardous tool. See relevant application example on-page 40. Maintenance speed control in rail dependent storage and retrieval equipment applications.

**DIGITAL INPUTS**

- **MV0** - Input for 2 PNP/NPN proximity switches
- **MV1** - Input for 1 incremental encoder (TTL, HTL or SIN/COS) and 1 or 2 PNP/NPN proximity switches
- **MV2** - Input for 1 or 2 incremental encoder (TTL, HTL or SIN/COS) and 1 or 2 PNP/NPN proximity switches

**SPEED THRESHOLDS**

Up to 8 logically selectable speed thresholds (freely configurable via MSD) for each logical output (axis).

**LED SIGNALLING**

Input/output status and fault diagnostics

**CONNECTION TO MASTER UNIT**

Via MSC connector (included)

**ACCESSORIES**

- **SAFECODER** - Safety Sin/Cos incremental encoder. See page 15
- **MCCV** - Speed monitoring sniffer cable. See page 20

</table>

RJ-45 (1 for MV1, 2 for MV2) connectors for encoders and terminal blocks for proximity switches.

Max. input frequency for encoders: up to 500 KHz (300 KHz for HTL encoder).

Max. input frequency for proximity switches: up to 5 KHz.
MCT1 - MCT2
REMOTE INTERFACE UNITS

Interface module allowing the connection of remote expansions units via the MSC bus.

APPLICATION EXAMPLE

Ideal solution for the interconnection of the safety functions of more machineries on a single production line.

CONNECTIONS

- MCT1 - 1 connection: 1 input or 1 output to be placed at the beginning or at the end of the network
- MCT2 - 2 connections: 1 input and 1 output

COMPATIBILITY

M1 and M1S

TECHNICAL FEATURES

Connections

- MCT1 - 1 connection: 1 input or 1 output to be placed at the beginning or at the end of the network
- MCT2 - 2 connections: 1 input and 1 output

Cable

Shielded RS 485 serial interface compatible cable (4 wires + shield) via the connector block. We recommend the use of Reer's MCTx cables for a correct operation of the system

Total distance

- Up to 50 m for each connection (total distance up to 250 m).
- Max. 5 MCT expansions units

LED signalling

Module status and fault diagnostics

Connection to Master Unit

Via MSC connector (included)

HM1
DISPLAY UNIT

Alphanumeric display. It displays the messages programmed using the HSD software.

APPLICATION EXAMPLE

Used in control panels to display status messages as diagnostic or operation functions of the safety system. Can be also used to display other functioning messages of the machine or the plant.

TECHNICAL FEATURES

Display

- Green display LCD 2x16

Ports

- 2 configurable RS 485 serial ports USB port for messages on display programming

Inputs

- 4 inputs for the connection with Mosaic: 2 synchronous serial ports (clock + data) or 4 asynchronous serial ports (data)

Connection to Master

HM1 can be connected to Mosaic in 3 ways:

- Wired to a status output connected to the serial operator, asynchronous serial connection Max 32 status displayed.
- Wired to 2 status outputs connected to the serial operator, synchronous serial connection Max 16 status displayed.
- Wired to the serial MBx module via RS 485 serial port, all I/O statuses and diagnostic displayed.

MBx
FIELD-BUS INTERFACE UNITS
Expansion unit for connection to the most common industrial Field-bus systems for diagnostics and data communication.

APPLICATION EXAMPLE
In all applications where it is required to communicate between the machine’s safety system and the PLC control.

MBP - Profibus DP
MBD - DeviceNET
MBC - CANopen
MBEC - EtherCAT
MBEI - Ethernet IP
MBEP - PROFINET
MBU - Universal Serial Bus
MBMR - Modbus RTU
MBEM - Modbus TCP
MBCCL - CC-Link

COMPATIBILITY
M1 and M1S

TECHNICAL FEATURES
Ports
RS 485 serial ports for I/O Bus expansion
USB port for configuration

Connection to Master Unit
Via MSC connector (included)

1100059 MBCCL CC-link expansion module *
1100082 MBMR Modbus RTU expansion module
1100083 MBEM Modbus TCP expansion module *

* All Ethernet modules have a double RJ45 port

MOS8 - MOS16
STATUS OUTPUTS EXPANSION UNITS
Status outputs expansion units for the automation process with safety level: SIL 1 - SILCL 1 - PLC c

APPLICATION EXAMPLE
Modules for automation process where status outputs are required. With these units, Mosaic controller can also be used as a PLC for automation.

SAFETY LEVEL
SIL 1

STATUS OUTPUTS
8 (MOS8)
16 (MOS16)

COMPATIBILITY
M1 and M1S

TECHNICAL FEATURES
Status outputs
MOS8 - 8 programmable digital status outputs (PNP 100 mA output current)
MOS16 - 16 programmable digital status outputs (PNP 100 mA output current)

LED signalling
Output status and fault diagnostics

Connection to Master Unit
Via MSC connector (included)

#### MECHANICAL CHARACTERISTICS

- Compact design: single module dimensions 22.5 x 99 x 114.5 mm
- Rear MSC rear bus connector for connection with other expansion modules
- Operating temperature: -10 ... +55 °C
- Storage temperature: -20 ... +85 °C
- Protection rating: IP20 for housing, IP 2X for terminal block
- Rail fastening according to EN 50022-35 standard
- Removable terminal blocks with screw or clamp contacts (24 x 22.5 mm)

**Power supply (VDC)**: 24 ± 20%

**Connections**: Removable terminal blocks, screw or clamp contacts

**Operating temperature**: -10 ... +55 °C

**Storage temperature**: -20 ... +85 °C

**Protection rating**: IP20 for housing / IP 2X for terminal block

**Fastening**: Rail fastening according to EN 50022-35 standard

**Dimension HxWxD (mm)**: 99 x 22.5 x 114.5

**NOTE**: The status outputs of all Mosaic modules can reach the safety level: SIL 1 - SILCL 1 - PL c
SAFECODER

Safety Sin/Cos incremental encoder. Together with Mosaic, it forms a SIL 3 certified safety function for speed monitoring. Available in two models: Shaft or Hollow shaft.

APPLICATION EXAMPLE

Any applications requiring speed monitoring of a rotating axis. See the application example on page 34.

Features a robust and reliable interface and the ability to handle high mechanical loads.

CONFIGURATION SOFTWARE

Every Master Unit comes with a complementary copy of the MSD designer software. The Master Unit configuration is done via USB connection.

- Drag&Drop functionality
- User-friendly
- Real-time I/O monitoring
- Simulation function
- Functional project validation
- Security password - 2-level passwords management for the prevention of unauthorised accesses and therefore of incidental modifications or tampering of the system configuration
- Reports and log files - Log File with project date of creation and related checksum (CRC 4-digit hexadecimal identification) is stored in the Main unit
- Project information - Project report with the following information: project name, configuration, safety information (PFHd, MTTFd, DCavg, resources used

Download the MSD software from www.reersafety.com/download/mosaic

MSD configuration software desktop.

</tbody>
</table>
### Input objects

**Switch**
Input for non safety switches or non safety signals. E.g.: restart button, position switch, enable signals etc.

**Sensor**
Input for non safety sensors or non safety signals. E.g.: Muting sensors, enable signals etc.

**Fixed Input**
Input fixed to logic level 0 (Low)
Input fixed to logic level 1 (High).

**Fieldbus Input**
Allows to receive signals (up to 8 bits) from the machine control unit via the field-bus module. The signal is connected directly into the diagrams without using any input block. **Warning:** FIELDBUS inputs are not a safety signals.

### Analog inputs

**Analog input**
Analog input functional blocks (4... 20 mA or 0 ... 10 V). This input can be configured as either single or double.

**More info:** on page 31.
Available with M1S and MA4.

### Analog operators

**Analog Comparison**
This operator verifies that two analogue inputs are equal within a selectable value. The output Q will be 1 (TRUE) when the condition is verified. In the event that the two signals are different, the output will be 0 (FALSE).

**Adder**
This operator performs the addition or the difference between the virtual analogue signals coming from an analogue functional block. The number of signals that can be added is from 2 to 8. Choosing to execute the addition and selecting the Arithmetic Average box the result of this operator will be the arithmetic average of the various inputs.

**Analog Comparator**
This operator inserts a comparator linked to the analogue output to which it is connected. The threshold value to be inserted will be in engineering units (e.g. Kg, ° C) and must be within the limits defined in the functional block to which it is connected. If the input value is lower than the threshold value, the output Q will be 0 (FALSE). It will be at level 1 (TRUE) if the input value to the operator is greater than or equal to the set threshold value.

### Speed monitoring objects

**Stand Still**
Check that the speed is zero or not greater than the values set.

**Stand Still and Speed Control**
Check that the speed does not exceed the values set for both the max. speed and zero speed.

**Speed Control**
Check that the speed is not greater than the values set.

**Window Speed Control**
Check that the speed is not lower or higher than the values set.
### Output objects

**OSSD (safety outputs)**
- PNP safety static outputs (dual channel, 400 mA).
- The 2 outputs cannot operate independently.

**Single OSSD (safety outputs)**
- PNP safety static outputs (single channel, 400 mA).
- The outputs can operate independently.
- Available with M1S, M18O4 and M04LHC58 units.

**Status (signal output)**
- PNP static outputs (single channel, 100 mA).
- Can be connected to any point in the project.

**Serial Output**
- It makes possible the transmission of information status to a PLC or HM1 without the need to use fieldbus modules. The Serial Output operator outputs the status of up to 8 inputs, serializing the information.
- Max. number of operators: 4 - total 32 information status.
- The serial line can be:
  - Synchronous (1 clock + 1 data output)
  - Asynchronous (1 Manchester coding data output). For a typical application sample, see HM1 on page 14.

### Comments

**Comments and Title**
- Add comments to your projects and sign it with a dedicated title box.

### Interpage operator

**Interpage**
- The operator Interpage is used to connect parts of the diagram without trace physically the linking. Simply assign the same link identifier operators to Interpage in and Interpage out.
- Operators Interpage that allow connection of parts of the diagram only by assigning a name to the connection identifier.
Logical operators - Up to 64 (M1) or 128 (M1S) logical operator can be used

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AND</strong></td>
<td>Logical AND returns an output of 1 (TRUE) if all the inputs are 1 (TRUE).</td>
</tr>
<tr>
<td><strong>NAND</strong></td>
<td>Logical NAND returns an output of 0 (FALSE) if all the inputs are 1 (TRUE).</td>
</tr>
<tr>
<td><strong>NOT</strong></td>
<td>Logical NOT inverts the logical status of the input.</td>
</tr>
<tr>
<td><strong>OR</strong></td>
<td>Logical OR returns an output of 1 (TRUE) if at least one of the inputs is 1 (TRUE).</td>
</tr>
<tr>
<td><strong>XOR</strong></td>
<td>Logical XOR returns an output 0 (FALSE) if the input’s number at 1 (TRUE) is even or the inputs are all 0 (FALSE).</td>
</tr>
<tr>
<td><strong>NOR</strong></td>
<td>Logical NOR returns an output of 0 (FALSE) if at least one of the inputs is 1 (TRUE).</td>
</tr>
<tr>
<td><strong>XNOR</strong></td>
<td>Logical XNOR returns an output 1 (TRUE) if the input’s number at 1 (TRUE) is even or the inputs are all 0 (FALSE).</td>
</tr>
</tbody>
</table>

**Multiplexer**

Logical Multiplexer forwards the signal of the inputs to the output according to the SEL selection. If the SEL1÷SEL4 have only one bit set, the selected In n is connected to the Output. If the SEL inputs are:
- more than one = 1 (TRUE)
- none = 1 (TRUE).

The output is set to 0 (FALSE) independently from the In n values.

**Logical Macro**

Groupings can be created with a maximum of three operators of different types for a total of max. 8 inputs. This allows to increase the maximum number of operators used.

**Memory operators**

<table>

</tr>
<tr>
<td><strong>Long delay</strong></td>
<td>This operator allows to apply a delay (up to 15 hours) to a signal by setting the output to 1 (TRUE) after the set time, against a change in the level of the input signal. Available with M1S.</td>
<td><img src="image6" alt="Long delay" /></td>
</tr>
<tr>
<td><strong>Delay line</strong></td>
<td>When the signal IN is moved to 0 logic level, this operator inserts a delay to a signal carrying the output OUT to 0 after the set time. If before the end of the set time the input IN returns to 1, the output OUT still generates a pulse signal with this duration: about 2 times the response time plus the delayed time set. Differences with dealy: delay Line operator does not filter any input interruptions less than the set time.</td>
<td><img src="image7" alt="Delay line" /></td>
</tr>
<tr>
<td><strong>Long delay line</strong></td>
<td>When the signal IN is moved to 0 logic level, this operator inserts a delay (up to 15 hours) to a signal carrying the output OUT to 0 after the set time. If before the end of the set time the input IN returns to 1, the output OUT still generates a pulse signal with this duration: about 2 times the response time plus the delayed time set. Differences with dealy: long delay Line operator does not filter any input interruptions less than the set time. Available with M1S.</td>
<td><img src="image8" alt="Long delay line" /></td>
</tr>
<tr>
<td><strong>Delay Comparator</strong></td>
<td>This operator allows to compare the value of the Long delay timer with the set threshold value. The output will be kept to 0 (FALSE) until the timer value is lower than the threshold value. The output will be set to 1 (TRUE) for timer values equal to or greater than the threshold value. Warning: the Delay Comparator operator can only be connected to an output of a Long delay operator. Available with M1S.</td>
<td><img src="image9" alt="Delay Comparator" /></td>
</tr>
</tbody>
</table>
| **Pre-reset operator** | **Pre-reset**  
This operator allows to memorize the status of the input signal following the correct sequence of the two PreReset and Reset signals: transaction (0-1-0) of the PreReset signal followed (within the set time) by the transition (0-1-0) of the Reset signal.  
The 0-1-0 transition of the signals, to be considered valid, must take place in a time between 500 msec and 5 sec. Available with M1S. | ![Pre-reset operator](image10) |
| **Reset operator** | **Reset**  
This operator resets the Mosaic system in presence of errors on the inputs or outputs. This operator generates a reset of the system when the corresponding input is a double transition OFF-ON-OFF of less than 5s. More info: “Reset operator” on page 29. | ![Reset operator](image11) |
Safety Guard Lock operator

Guard Lock

The Guard lock operator controls locking/unlocking of an electromechanical guard lock by analysing consistency between the Lock command and the status of an E-GATE and a FEEDBACK.

More info: “Guard Lock operator” on page 32.

Network operator

Network

Is a serial connection (Loop) of several Mosaic Master unit (with possible expansions). This operator allows stop and reset commands to be distributed in a simply Mosaic network.

More info: “Network operator” on page 32.

Digital comparator

The Digital Comparator operator allows to compare a series of input signals (from 2 to 8 max.) with a decimal constant (range 0 to 255).

The input In1 is the LSB (least significant bit) while the input In8 (or lower if the number of inputs selected is less than 8) is the MSB (most significant bit).

The comparators are: < Less; > = Greater or equal; > Greater; <= Less or equal; = Equal; ! = Different

Selecting “Signal Comparison”, the Digital comparator operator will compare the first four inputs A (In1_A ... In4_A) and the second four inputs B (In1_B ... In4_B).

The comparators are the same as described above.

Available with M1S.

Counter operators

Counter

Counter operator is a pulse counter that sets output Q to 1 (TRUE) as soon as the desired count is reached. There are 3 operating modes: Automatic, Manual, Automatic + Manual.

Counter Comparator

This operator allows to compare the counter value with the set threshold value. The output will be kept at 0 (FALSE) until the counter value is lower than the threshold value. The output will be set to 1 (TRUE) for counter values equal to or greater than the threshold value.

Warning: the Counter Comparator operator can only be connected to an output of the Counter operator.

Available with M1S.

Muting operator objects

L Muting

With 2 Muting sensors for one-way openings (exit only). Suitable solution for any applications of pallet exit.

T Muting

With 2 Muting sensors for two-way openings (entry/exit). Suitable solution for the most common pallet infeed/outfeed applications.

T Muting “Sequential”

With 4 Muting sensors for two-way openings (entry/exit). Suitable solution for transparent material and application with presence of a pallet with reduced width or not centred with respect to the conveyor.

T Muting “Concurrent”

With 4 Muting sensors for two-way openings (entry/exit). Suitable solution for transparent material and application with presence of a pallet with reduced width or not centred with respect to the conveyor.

Muting Override

Are available two selectable functional mode:
Override with hold to run action
Override with one pulse action.

INSIGHTS

A DETAILED LOOK INTO THE MOST INTERESTING FEATURES OF MOSAIC MSD

Property window

The property window of each function block allows configuring each block parameters in a simple and easy way.

This allows achieving an important level of customisation for each project tailoring Mosaic behaviour to each particular application.

Automatic or Manual Reset

Manual Reset: If selected this enables the request to reset each time the area protected by the safety light curtain is occupied. Otherwise, enabling of the output directly follows the input conditions.

ESPE configuration example

There are two types of reset: Manual and Monitored. When Manual is selected the system only verifies the signal’s transition from 0 to 1. If Monitored is selected the double transition from 0 to 1 and then back to 0 is verified.

Manual and monitored reset

Reset operator

This operator resets the Mosaic system in presence of errors on the inputs or outputs.

This operator generates a reset of the system when the corresponding input is a double transition OFF-ON-OFF of less than 5s.

Network_In

This function block creates a network input interface connection, generating on the OUT output a high logical level (1) when the line is high, 0 otherwise.

This input can only be allocated to Mosaic Master.

Network_IN Object

This input must be used when Mosaic OSSD or status outputs are connected to the inputs of a second downstream Mosaic or together with the NETWORK operator.
Clocking operator

This operator has up to 7 inputs to control the output Duty Cycle. Related to the selected input, this operator will generate a clock with different duty cycle.

Clocking operator property

It can be used, for example, to pass or receive the status information to or from a PLC.

Clocking operator connection sample

T Muting «Sequential»

The activation of the Muting function occurs following sequential interruption of the sensors S1 and S2, subsequently S3 and S4 sensors (without time limit). If the pallet proceeds in the opposite direction the correct sequence is: S4, S3, S2, S1.

Preliminary condition: The Muting cycle can only start if all the sensors are 0 and the inputs are 1 (sensor and light curtain free).

Example of Sequential Muting parameters configuration

Muting Override

Enable only button: It is possible to enable/disable the Muting function depending on the sequence of the machine. This increase the safety.

Example of Sequential Muting parameters configuration

T Muting «Concurrent»

The activation of the Muting function occurs following interruption of the sensors S1 and S2 beams and then of the sensor S3 and S4: the two sensor must be interrupted within a configurable safety timeout (sensor time) the maximum duration of the Muting status is limited by a timeout. \( S_1 \rightarrow X \text{ sec.} \rightarrow S_2 \rightarrow S_3 \rightarrow X \text{ sec.} \rightarrow S_4 \)

Where \( t \) is a value that depends on the “timeout”, \( X \) is the “sensor time”. The “Minimum sensors time option” allows to stop the Muting function if the transit in front of the sensors 1-2 and 3-4 takes place with a time less than 150 ms. This allows to detect the transit of much faster than a pallet person.

Example of Muting override configuration

Example of Sequential Muting parameters configuration

Example of Muting override configuration
Analogic Inputs configuration

The input type “Single” allows to connect one analogue sensor (current or voltage) to the module input. By selecting “Redundant”, it will be possible to connect two analogic sensors to the input of the module. The signals of the two sensors are analysed and compared between each other.

The “Measurement unit” field allows to enter the engineering units measured through the sensor (i.e. Kg, °C, etc.).

In the “scale” fields, it’s possible to insert the minimum value of the quantity corresponding to the minimum signal coming from the sensor in the “4mA or 0V” box and the maximum value in the “20 mA or 10V” box.

The two check boxes “0-20 mA” and “0-10 V” allows to define the sensor output type: voltage instead of current.

The windows comparator selection activates an analogue window comparator. The output OUT1 will be 1 (TRUE) when the value read by the sensor is between the two thresholds. It will be 0 (FALSE) when the value read by the sensor will be outside the two thresholds. It is also possible to enter a hysteresis value.

Threshold 1,2 fields represents the threshold above which the output OUT1 will be 1 (TRUE). Below the set threshold the output OUT1 will be 0 (FALSE). Also in this case it is possible to insert a hysteresis value.

In the fields “Samples per second (2.5-4000)” it’s possible to enter the value that determines the number of samples per second of the analogue input signal.

Moreover, it is possible to enter the limit values below which (Minimum current value) or above which (Maximum current value) the ERROR output will be activated.

Are also available a series of values that allows to check the correct operation of the analogic sensors.
Guard Lock operator

The Gate input is connected to the functional block e-gate. This is an example of Guard Lock configuration.

Sample of Guard Lock operator connection

1. The Lock_fbk input is connected to the functional block Lock_fbk (feedback from the lock)
2. The UnLock_cmd input (unlocks command) is connected to an input switch
3. The signal output will be 1 if the door is closed and the guard lock is locked
4. When an unlock command is applied to the input (UnLock_cmd), the output signal will be set to “0” and after a programmable time Time_Lock (2 sec. in the example) the guard lock is unlocked through the LockOut output

Network operator

It allows loop connection (Loop) of several Mosaic Master units (with expansions). This operator allows stop and reset commands to be distributed in the Mosaic network.
Speed monitoring object configuration example

Example of speed monitoring of one axis. Monitoring of stand still and speed control with selectable 2 thresholds.

Interpage operators

Interpage operators is a label assigning a name to a certain logical interconnection.

Considerable simplification and readability of the diagram.

Diagram with wires

To simplify the names assignment a drop-down menu, that let's you choose the name of the “Interpage out” among those assigned to the operators “Interpage in”.

The same diagram with Interpage function applied

Interpage operator advantages
REAL TIME MONITOR

The I/O MONITOR allows the real-time monitoring of all the I/Os of a Mosaic system and the diagnostic information about a working system.

VISUALIZATION

Graphic visualization

Text visualization

Real-time Monitor
The Simulator allows to verify the functionality and correct operations of a project created with MSD before the assembly of the machinery.

It allows activate the inputs of the system manually or in a programmed way in order to ensure the outputs gained are correct.

**NOTE:** the simulation feature is available with MSD version 1.5 and M1 firmware version 3.0 or higher.

### SCHEMATIC SIMULATION

The schematic simulation allows to “start” the project via a dedicated menu and to operate directly on any of the inputs to verify the logic of the system.

Simulation can start, stop or restart via dedicated menu

Timing settings
When timer operators are included in the actual configuration

Likewise in the monitor Function, also in this case the color of the line indicates the signal status: green means the signal is at LL1, red means the signal is at LL0
MANAGING GRAPHIC SIMULATION

The graphic simulation allows to load a number of programmed inputs status change and to verify the logic of the system as a graphical output diagram. This methodology allows to create templates replicating the exact functionality of a machinery and apply them on different projects.

Template Stimuli
Based on the schematic loaded, it creates a template file to fill with the desired values. The user can modify the status of the input signals in a certain time.

Parameter Editor
The user must save the file with the required name and open it again with a text editor to modify the parameters.

Simulation with Stimuli
Load the template file saved and starts the simulation.

Load simulation
With this feature is it possible to load a previous completed simulation.

Traces visibility
With this option the user could select the traces (waveform signal) to be displayed in the graph or not.

At the end of the simulation a graph with all the resulting signals is showed.
HSD SOFTWARE
MESSAGES EDITOR FOR THE HM1 DISPLAY

HSD is the editor software that allows programming of the HM1 device.

HM1 can be connected to the Mosaic system in 3 ways:

1. Wired to a status output connected to the serial operator, asynchronous serial connection. Max 32 status displayed. See picture 1
2. Wired to 2 status outputs connected to the serial operator, synchronous serial connection. Max 16 status displayed. See picture 2
3. Wired to the serial MBx module via RS 485 serial port, All I/O statuses and diagnostic displayed

The digital signals from the output status or serial operator can be converted to display messages on the display HM1 through this HSD editor software.
SAFETY MANAGEMENT OF A PALLETIZING SYSTEM WITH TWO ROBOTIC CELLS

The system comprises a conveyor that transports boxes to two robotic palletization cells. The machine is completely protected by a fence with three access gates (one for each robotic cell and one for the conveyor area) equipped with a safety switch. When the gate of the robotic cell is open, the corresponding robot stops. When the conveyor area gate is open the entire plant stops.

The completed pallets are collected by a forklift truck through the access gate which is protected by a safety light curtain. The access of the forklift truck for collecting the pallet, when the robot is stopped in the rest position, by reason of the safety light curtains, prevents the robot to start.

In all other phases of processing, occupation of each light curtain causes the related robot to stop. The related manual restart control is located close to each light curtain. The system is equipped with four emergency push buttons (e-stop).

Total safety devices: 2 safety light curtains, 2 restart buttons for the safety light curtains, 3 safety gate switches, 4 emergency push buttons.

Using conventional components – safety relay modules – to build up the safety circuit, it would be necessary to use at least six safety modules, wired to each other in order to perform the required functions: 2 safety relays for the light curtains, 3 safety relays for the gate switches, 1 safety relay for the emergency stop chain.

Solution with Mosaic

Using Mosaic to build up the safety circuit, it is sufficient to use:

- 1 M1 or M1S Master unit
- 1 MI8O2 expansion unit

Note 1: the Reset buttons are not displayed on the diagram because they are directly connected to the feedback of the OSSD safety outputs (inputs FBK_RST1, FBK_RST2. The 4 E-STOP are connected in series and in the diagram they are represented with a single block.

Note 2: 3 operators Inter-page (2 In and 1 Out) were included in the diagram. These allow you to link the inputs and outputs of the logic gates “&” without having to draw the line.

16 inputs - 4 OSSD pairs - 8 test outputs - 4 signal outputs
The operator is required to load and unload the workpiece. The machine is protected by two horizontal safety light curtains. In this case, each light curtain must be equipped with the Muting function so as to permit access to the hazardous area by personnel during the non-hazardous part of the machine cycle.

Depending on the position of the tool, which is the hazardous element, one of the two light curtains (the one facing the tool working area) is active, while the other is muted so that the operator can load/unload the workpiece.

The Muting condition of the two safety light curtains will then be inverted when the tool is required to operate on the opposite side of the machine.

The machine is completely protected by a fence with an access gate equipped with a safety switch. When the gate is opened, the machine stops. The related manual restart control is located close to each safety light curtain. The system is equipped with three emergency push buttons which, if activated, stop the machine.

Total safety components: 2 safety light curtains, 2 restart buttons for the safety light curtains, 1 safety gate switch, 3 emergency push buttons.

Using conventional components – safety relay modules – to build up the safety circuit, four safety modules would be necessary: 2 safety modules for the safety light curtains with Muting function, 1 safety module for the gate switch, 1 safety module for the emergency stop.

Solution with Mosaic

Using Mosaic to build up the safety circuit, it is sufficient to use:
- 1 M1 or M1S Master unit
- 1 MI8 expansion unit

**NOTE**: the Reset buttons are not displayed on the diagram because they are directly connected to the feedback of the OSSD safety outputs (inputs FBK_RST1, FBK_RST2).

The 3 E-STOP are connected in series and are represented in the diagram with a single block.

The diagram also shows 2 status outputs used to drive the indication lights of the active Muting.
SPEED MONITORING FOR A HAZARDOUS TOOL

In this example, to place or remove tooling or to perform maintenance activity where is necessary for the operator to enter the dangerous area.

As long as the tool is working at the normal speed the GUARD LOCK is locked and the access to the hazardous area is not allowed.

Access to the hazardous area is allowed either when the working cycle is over or when the operator switches the MOD SEL to “Access Request”. When the tool stops the lock is unlocked and allows the opening of the door. In this case the speed controller verifies that the tool is stopped (zero speed).

For maintenance, it is necessary that the system operates at reduced speed. The operator will have to act on the selector (MOD-SEL) and bring it in the “Maintenance” position. When the tool stops the lock is unlocked and allows the door opening. If the tool has to be kept moving for maintenance reasons as the operator is inside the hazardous area, this is possible through the Grip Switch. The speed monitoring device detects whether the speed of the tool is under a defined threshold set through the MSD. If the threshold is exceeded or the Grip Switch is released the machine is immediately stopped.

On the operator panel are available the emergency stop (e-stop) button and reset button to restore the normal operating conditions of the safety lock after the operator intervention.

Using Mosaic to build up the safety circuit, it is sufficient to use:
- 1 M1 or M1S Master unit
- 1 MI6 expansion unit
- 1 MV0 expansion unit for safety speed monitoring

Safety speed monitoring

Comments

Using Mosaic, all the safety logic circuitry is implemented using the graphic interface and not by hard-wiring the outputs of the relay modules to each other. Correct functioning of the logic circuitry is checked during the design phase by the validation function and can be tested with the simulation and monitor function during installation. During the design phase, safety functions can be easily added or removed, for example adding other sensors or zones. Start up tests can be inserted in order to detect any attempt of by-passing the safety system, which is always a possibility with traditional relay modules.
TYPICAL APPLICATIONS

- **Pallets production machines**
- **Wood-working machines**
- **Painting machines for wood-working industry**
- **Handling machines for wood-working plants**
- **Wood-working machines squaring edgebanders**
- **Robots**
- **Plastic film production machines**
- **AGVs (Automatic Guided Vehicle)**
- **Pad printing machines**
- **Bending machines**
- **Palletising systems**
- **Palletising and bottling plants**
Elevators
Crane packer/unpacker and palletising systems

Beam drilling and sawing machines
Panel sizing saws

Vertical lift storage system
Rail dependent storage and retrieval equipment

Industrial boilers
Industrial thermal processes

Wood working CNC
Cutting tables for glass

Industrial plant application with MA2 and MA4 Analogic input unit:
Loading cells (weight, compression and traction measurements), pressure switches, temperature measurements, flow measurements, level measurements, etc.
We put our Customers always first

ReeR after sales service is committed to support all customers that need technical guidance regarding functionality, handling and installation of our products.

Customer Service Hotline
+39 011 24 82 215
Monday to Friday 8.30 - 12.30 and 13.30-18.00 (CET)

More than 60 years of quality and innovation

Founded in Turin (Italy) in 1959, ReeR distinguished itself for its strong commitment to innovation and technology. A steady growth throughout the years allowed ReeR to become a point of reference in the safety automation industry at a worldwide level. The Safety Division is in fact today a world leader in the development and manufacturing of safety optoelectronic sensors and controllers. ReeR is ISO 9001, ISO 14001 and ISO 45001 certified.
